

The Fourth Law: A robot must promote and prioritize the overall well-being of humanity.

The proposed Fourth Law of Robotics, "A robot must promote and prioritize the overall well-being of humanity," enhances Asimov's original Three Laws by emphasizing the proactive contribution to human welfare. It encourages robots to make ethical decisions, resolving conflicts in favor of humanity and considering long-term consequences. This law complements the existing laws by guiding robots to act in the best interests of society, taking precedence over individual orders when necessary. It also promotes social and environmental responsibility, ensuring robots consider the impact of their actions on the planet and its inhabitants. Overall, the Fourth Law enhances the ethical behavior of robots while maintaining consistency with the original laws.
